

Plantophile®

(fr.) un amoureux des plantes

— autumn winter 2019 - 2020 —

The story behind the brand

As the name Plantophile indicates we are lovers of plants in the first place but we also love home accessories and we build our collection by combining those two. In the new collection we offer In addition to our Green Lifestyle range, accessories and pots & plants separately to allow our customers to mix and match.

In the two years since the founding of Plantophile we have built up a good and fruitful business in several European countries and we are very grateful to all our partners. Our main goal for the upcoming season is to create more brand awareness and therefore we will be concentrating on marketing and Social Media. Hopefully we can rely on you to help us share, like and post.

We are looking forward to a friendly and fruitful collaboration with all our partners. Wishing you all a good season in terms of sales and pleasure in business.

Kind regards,
The Plantophile team

Care instructions terrariums :

The semi self-sufficient terrariums (SS) are build up differently and have a micro climate inside. The plants release oxygen that will be transferred into humidity. The plants create enough humidity on themselves mostly even too much, this will not be regulated by itself. It is important to open the deck for a couple of hours when there is too much humidity on the inside of the terrarium.

In case of too much humidity mould can appear. Most of time the plants can be (partially) saved if you open the lid longue enough, you can take of the leaves and branches that have mould. You can easily replace one of the plants in case of severe mould. The plants will grow and in the right atmosphere they can grow very quickly. All plants in the terrariums can be trimmed with regular scissors. All our terrariums are built with special plants that are able to live in a closed environment.

Care instructions terrariums :

The self-sufficient terrariums (S) are build up with special materials that create a real ECO system inside the bottle. Those terrariums must be closed two weeks after the production date (date is on the label) to be never opened again. It is a real forest in a bottle, this means that brown leaves can appear and fall off, this will be compost for the ECO system. In extreme cases, like extreme heath there can be occasionally too much humidity and in this case you can open the lid for a couple of hours.

 Please make sure that your terrarium gets some daylight.

 The best temperature is between 15-25 degrees.

 Do not place your terrarium just above the heater.

PP0081

Ø: 12 cm - ↑: 12 - 25 cm - MOQ: 6

Care instructions potted plants:

All our plants have been selected on their low care. The Cactus is a very beautiful and easy plant. Giving a small amount of water once every 2 weeks is sufficient. They like to be in the sun but can also do without.

The succulents are very easy to care for too. Just give them a little water once every 2 weeks and they don't necessarily need sunlight. Just don't give them too much water.

The green plants need a little water once a week. They'll do well in light but will also survive in a dark place.

PP0052

PP0011 - PP0010

Ø: 3 cm - ↑: 15 cm - MOQ: 24

Ø: 5 cm - ↑: 18 cm - MOQ: 16

Care instructions air-plants:

As the name indicates, these plants are nurtured by the atmospheric humidity in their natural environment (tropical forests). In bathrooms the air-plants can live and grow without any additional watering. In our living rooms or comparable spaces in terms of atmosphere they will need some extra help. They need to be vaporised every two weeks.

Like all plants, the air-plants love sunlight but they don't need it to survive.

The best temperature is between 15-25 degrees.

Do not water the air-plants in closed bottles. They are self-sufficient and water will cause mould.

clusia collection

PP0028

Ø: 4 cm - ↑: 20 cm - MOQ: 30

PP0072

Ø: 12 cm - ↑: 42 cm - MOQ: 6

Care instructions Clusia (sprout) in water :

The Clusia sprout always needs to be with his roots in the water, but be careful that the plants/leave do not get under water (only the roots). When the plant gets too big for the tube, you can easily trim it with regular scissors. You can also plant the Clusia in a pot with regular potting soil, the tube can then be used to make new sprouts.

The Clusia loves sunlight but they don't need it to survive.

The best temperature is between 15-25 degrees.
